

PURBECK INLAND FREESTONE

SAMPLE SIZE:	90x90mm (or 1:1 at A4)
SAMPLE SURFACE FINISH:	honed (approx 220 grit)
QUARRY LOCATION:	Purbeck, Dorset, England
GEOLOGY:	Cretaceous Limestone
COLOUR:	beige to buff
POLISH ACHIEVABLE:	medium
APPLICATIONS:	interior and exterior
BRE DATA:	available on request

RECENT PROJECTS: Highcliffe Castle; Westminster Abbey;
Shepton Mallet Town Centre; Tower of London; Christchurch
Priory; Flower Room Salisbury Cathedral

Inland Freestone is a prized fine-grained and durable limestone composed of tiny crushed fossilised shells. This pale limestone has a soft and subtle fossil pattern which varies in tone through the height of the block from beige to buff. This stone's subtle texture creates a refined, understated look.

Inland Freestone has been used for architectural masonry for centuries, with buildings like Newton Manor in Swanage- built in the 1700s- demonstrating its durability. It also makes an excellent choice for landscaping, and we regularly supply setts for use in contemporary garden designs.
